

RamKeeper Modification for Apple IIGs 1 Meg (Rev. 3 Motherboard)

Because of the new board layout of Apple's new IIGS 1 Meg (Rev. 3 motherboard), we've had to modify a chip on the RamKeeper. If you have Apple's new IIGS 1 Meg, the RamKeeper in this package is ready to be installed. If you have the earlier IIGS, the RamKeeper requires a single chip swap to work.

Compare your IIGS' motherboard with the drawings below to determine which you have.

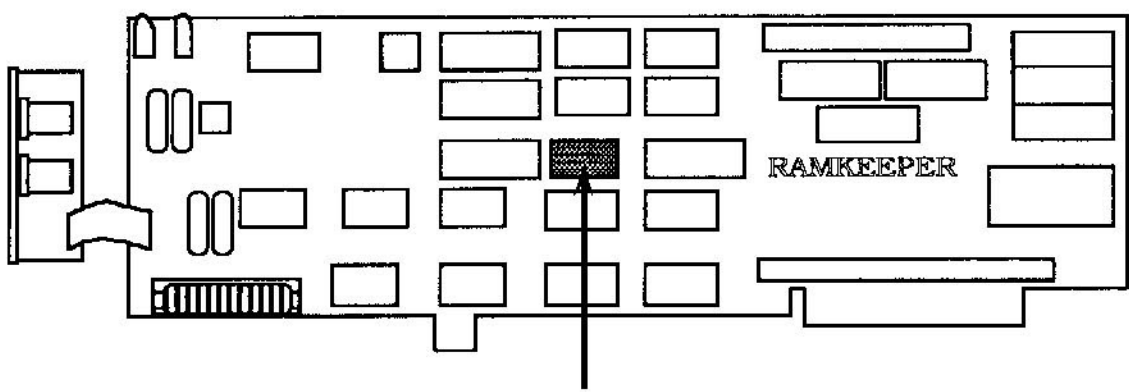

Earlier IIGS Motherboards
No memory chips,
1 ROM next to CPU

Rev 3 IIGS Motherboards
8 memory chips,
2 ROMs next to CPU

Apple IIGS Models

If you have the *earlier* GS, substitute the 74F27 chip shown below.

Swap the 74F27
if you have the earlier IIGS

If you aren't familiar with the process of changing chips, refer to the "Chip Replacement Instructions" sheet included in the chip package.
